

Malignant melanoma: incidence, mortality and survival rates in the West Midlands Strategic Health Authority and England

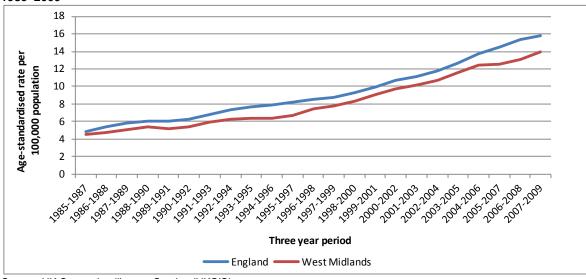

May 2012

This factsheet presents data for ICD-10 C43 "Malignant melanoma of skin". The latest available incidence, mortality and survival data have been used.

Incidence rates

The 3-year average age-standardised incidence rate of malignant melanoma in the West Midlands Strategic Health Authority (SHA) for males and females followed the same trend as the rate for England: an increase in incidence over the last 20 years. During this time, the West Midlands SHA generally had a lower incidence than England. In 2007–09, the 3-year average age-standardised incidence rate of malignant melanoma for males was 14.0 (West Midlands SHA) and 15.8 (England) per 100,000 population and for females the rate was 13.1 (West Midland SHA) and 16.3 (England) per 100,000 population. From 1985–97, the age-standardised incidence rate was generally lower for males than for females.

Mortality rates

The 3-year average age-standardised mortality rate from malignant melanoma in the West Midlands SHA for males and females followed a similar trend to the rate for England over the last 20 years: for males the rate increased and for females it has stayed constant despite some fluctuations in the SHA rates. In 2008–10, the 3-year average age-standardised mortality rate from malignant melanoma for males was 3.0 (West Midlands SHA) and 3.2 (England) per 100,000 population, and for females the rate was 2.0 (West Midlands SHA) and 2.1 (England) per 100,000 population. From 1995-97, the agestandardised mortality rate was higher for males than females.

Survival rates

Five-year survival rates from malignant melanoma showed little difference between the West Midlands SHA and England for both males and females diagnosed in 2003–05; the survival rate for males was 84.3% in the West Midlands SHA and 83.1% in England, while for females the rates were 92.8% in the West Midlands SHA and 91.6% in England. Comparing survival for people diagnosed in 1985–87 and 2003–05, relative survival increased by 12.4% for males and by 10.1% for females in West Midlands SHA.

About the South West Public Health Observatory

The South West Public Observatory (SWPHO) is part of a network of 12 public health observatories working across the five nations of England, Scotland, Wales, Northern Ireland and the Republic of Ireland. The nine Public Health Observatories in England work together through a single work programme which contains both national and local elements. We produce information, data and intelligence on people's health and health care for practitioners, policy makers and the wider community. Our expertise lies in turning information and data into meaningful health intelligence to support decision makers.

On behalf of the Department of Health, the SWPHO works in partnership with the NHS, local authorities, researchers, national agencies as well as agencies in the South West.

The SWPHO incorporates the National Drug Treatment Monitoring System South West (NDTMS–SW), and in April 2005 merged with the South West Cancer Intelligence Service (SWCIS).

For more information about the SWPHO and its partner organisations, please visit www.swpho.nhs.uk
